

**A SLEEPING FLOOR  
MADE OF  
PRE-CAST BLOCKS**

**1**

Figs. 1 and 2—The blocks are laid on a thin layer of cement mortar. The tongues and grooves of the blocks enable them to be interlocked.

**2**

Fig. 3—The front is finished with a strip of solid concrete, sealing the air spaces. The strip is bevelled as shown.

**3**

Fig. 4—The work is completed by plastering the whole surface with a 3 to 1 sand-cement plaster not more than  $\frac{3}{8}$  in. thick. It is important that a very wet mix of plaster is used, as the blocks draw moisture out of the plaster, making it hard to work.
