

Clover growing profusely among tussock vegetation. Good strikes are obtained where there is sufficient cover to protect the seedlings from the extremes of climate that are common in the area.

Improvement of

Tussock Land

Omarama

Typical undulating downlands near Lake Ohau which grow excellent red and white clover. Topdressing is done during winter with 2cwt. of superphosphate per acre.

As the inland high tussock country is improved by modern methods such as aerial topdressing and oversowing and carrying capacities are consequently improved the necessity arises of having to provide adequate winter feed. On "Ribbonwood" this has been done largely by setting aside areas for hay, and upward of 3000 bales have been made in a year.
