

ings, for of the whole colony I estimate that one-twentieth came back to the laboratory—the old position of the hive. On the other hand, I moved a hive similarly but opened it after dark, and then next day no bees came back to the old position of the hive, because, I suppose, when the first few came out at daylight they did not fly off to work at once, but took short flights round the hive and so recognised their new location.

ART. LX.—*List of Papers on the Geology of New Zealand.*

By A. HAMILTON.

[*Read before the Wellington Philosophical Society, 18th March, 1903.*]

IN this list of papers on subjects relating to the geology of New Zealand I have endeavoured to bring together in a convenient form for reference the titles of the various reports, papers, essays, and stray notes not only directly and purely geological, but those which contain information on subjects such as mining and mineralogy, petrography and palæontology, which must of necessity be considered by a practical geologist.

The chief store of information is, of course, the series of reports by Sir James Hector, Director of the Geological Survey of New Zealand, from 1862 to date; and it is hoped that, falling an elaborate and costly index to these reports, such as that published for the reports of the Geological Survey of Canada, the present list, arranged under the names of the various officers of the Survey and other writers, will have some value to those in search of information on any particular district or subject. The other publications which have been searched are the "Transactions of the New Zealand Institute," so far as published papers are concerned, extracts having been made from the Proceedings in only a few special cases, the "Quarterly Journal of the Geological Society" of London, the "Geologist," and sundry other publications in various parts of the world.

In some subjects, such as earthquakes, gold and coal mining, ironsand-working, many additions could be made to the list by those specially interested. I am in hope, however, that some one with leisure will not only greatly extend this list, but will rearrange the entries under headings similar to those in the annual "Geological Record," thereby making reference more easy.

The numerous palæontological papers treating of the extinct birds of New Zealand have been already given in a list published in vol. xxvi. of the "Transactions of the New Zealand Institute," and vol. xxvii., p. 229, 1894.

[NOTE.—In the following list "Trans." means the "Transactions of the New Zealand Institute."]
