A New Zealand Phytochemical Register—Part I.

By S. G. BROOKER, B. F. CAIN and R. C. CAMBIE

[Received by the Editor, August 6, 1962.]

Summary

A phytochemical register of New Zealand species is compiled and compounds obtained from each source cross-indexed according to chemical types.

INTRODUCTION

THE chemistry of the New Zealand native plants has been reviewed by Gardner (1923, 1924), Briggs (1947), and Murray (1949, 1950). As the bulk of the work in this field has been carried out since the publication of these reviews it appeared that a bibliography of the more recent work, but including the earlier work for the sake of completeness, would be of value. No attempt has been made to review the chemistry or to draw relationships between the botanical classification and the type of compound found. Rather, the compilation is intended as a register only which may facilitate the further investigation of New Zealand species.

In the register an attempt has been made to include all papers which reveal the isolation of compounds from the native plants, and where such compounds are new, papers dealing with their constitution and synthesis have been included. Compounds which have been incompletely characterized or whose structures are not completely elucidated have been listed in order to draw attention to some of the uncompleted problems which exist. References to the detection only of compounds or classes of compound (see Cain, Scannell and Cambie, 1961; Cain, La Roche and Cambie, 1962; Cambie, Cain and La Roche, 1961a, b and c) have been omitted. In scope the register covers all native species except the Gymnosperms and Lichenes. It is hoped to include work done on these groups in a further paper.

The first section of the paper lists botanical species and the compounds which have been isolated from them. The order of species and botanical authority follow that of Allan (1961). The authors of the original papers have been held respon-

sible for adequate botanical classification of their material, names have merely been modified to conform with modern terminology. All references are given in the appropriate places in this section. The Maori names are those given by Andersen (1926), and where the Maori name is unknown the generally accepted colloquial name is included.

In the second section the compounds isolated have been cross-indexed according to chemical type following the order given by Karrer (1958).

ACKNOWLEDGMENTS

The authors are greatly indebted to Dr R. C. Cooper, Auckland Institute and Museum, for checking all botanical and Maori names. Dr R. E. Corbett, University of Otago, and Dr W. E. Harvey, Victoria University of Wellington, kindly provided details of research from their laboratories.

RHAMNACEAE

Pomaderris kumeraho A. Cunn. (*P. elliptica* of Cheeseman) ("Kumarahou").

LEAVES: Quercetin, kaempferol, glycosides of quercetin and kaempferol, myricyl acetate, saponins, ellagic acid, certain O-methyl ethers of ellagic acid, leucocyanidin, leucodelphinidin. —

Cain, B. F., Cambie, R. C., 1959. *N.Z. J. Sci.*, 2: 240.

Cain, B. F. Person. Comm.

RUTACEAE

Phebalium nudum Hook. (“Mairehau”).

ESSENTIAL OIL: Citronellol, citral, camphene, limonene, terpinyl acetate, sesquiterpenes and sesquiterpene alcohols, acetic acid, isovaleric acid, cinnamic acid, unidentified phenol. —

Radcliffe, C. B., Short, W. F., 1928. *J. Soc. chem. Ind., Lond.*, 47: 324T.

BARK: D.-citronellal, geranial, neral, acetic acid, isovaleric acid, palmitic acid, cinnamic acid, isoeugenol, β -sitosterol, α -terpineol probably as isovalerate, furoquinoline alkaloids dictamnine, γ -fagarine, evolitrine, skimmianine, kokusaginine, 9-hydroxy-4-methoxy-furano (3,2-g) benzopyran-7-one, ellagic acid, phebalin ($C_{20}H_{18}O_4$, m.p. 175–176.5°), phebalarin ($C_{15}H_{18}O_6$, m.p. 125–126°), compound A ($C_{22}H_{44}O$, m.p. 81.5–82°), compound B ($C_{13}H_{26}O$, m.p. 94°), unidentified phenols. —
