

(c) Bark invertebrates in low hardwood forest (394 individuals in 16 samples), podocarp dominant forest (59 individuals in 5 samples), and *Nothofagus* dominant forest (347 individuals in 14 samples). The samples were taken from various localities in summer, each sample consisting of animals sifted through a 7mm-mesh sieve from the bark (or moss on bark) in the area of 30cm x 30cm.
